

Transpareo Rating System

Schematic representation how ratings are calculated.

Any property types can be defined in Transpareo, some of which can be configured to be rated as *very bad*, *bad*, *neutral*, *good*, or *very good*.

Each component can have multiple properties, some of which are rated. These scores are used to calculate an overall rating of the component.

The ratings of all product components are used to calculate the product score while taking into account extreme ratings and number of components.
